In [2]:
```
import pandas as pd

#Create the summary table
summary = pd.DataFrame({
    "Feed":["Horsebean","Linseed","Soybean","Sunflower","Meatmeal","Casein"]
    "Minimum": [108,141,158,226,153,216],
    "Mean (Average)":[160.20,218.75,246.43,328.92,276.91,323.58],
    "Maximum":[227,309,329,423,380,404]
    })
#Display the table
summary
```

Out[2]:

	Feed	Minimum	Mean (Average)	Maximum
0	Horsebean	108	160.20	227
1	Linseed	141	218.75	309
2	Soybean	158	246.43	329
3	Sunflower	226	328.92	423
4	Meatmeal	153	276.91	380
5	Casein	216	323.58	404

Business Recommendation

I would choose sunflower feed because its numbers are higher compared to the other types of feed. According to the summary table, sunflower has a minimum of 226, a mean of 328.92, and a maximum of 423. Casein has the second-highest numbers, but sunflower still performs better overall.

If I had to make a business decision based only on this data, I would choose sunflower. However, I would also consider the cost. If casein is cheaper than sunflower, I might choose casein instead because the numbers are not too far apart. This would help the business save money while still getting similar results.
